

## Ask Your Recycler

- Why kind of amalgam waste do you accept?
- Does your service include pick up or delivery?
- Do you provide packaging? If not, how should waste be packaged?
- Does your company accept empty amalgam capsules or extracted teeth with amalgam?
- Do you accept whole filters from the vacuum pump?
- What type of recycling licenses do you have?
- Do you provide documentation that the material was properly recycled?

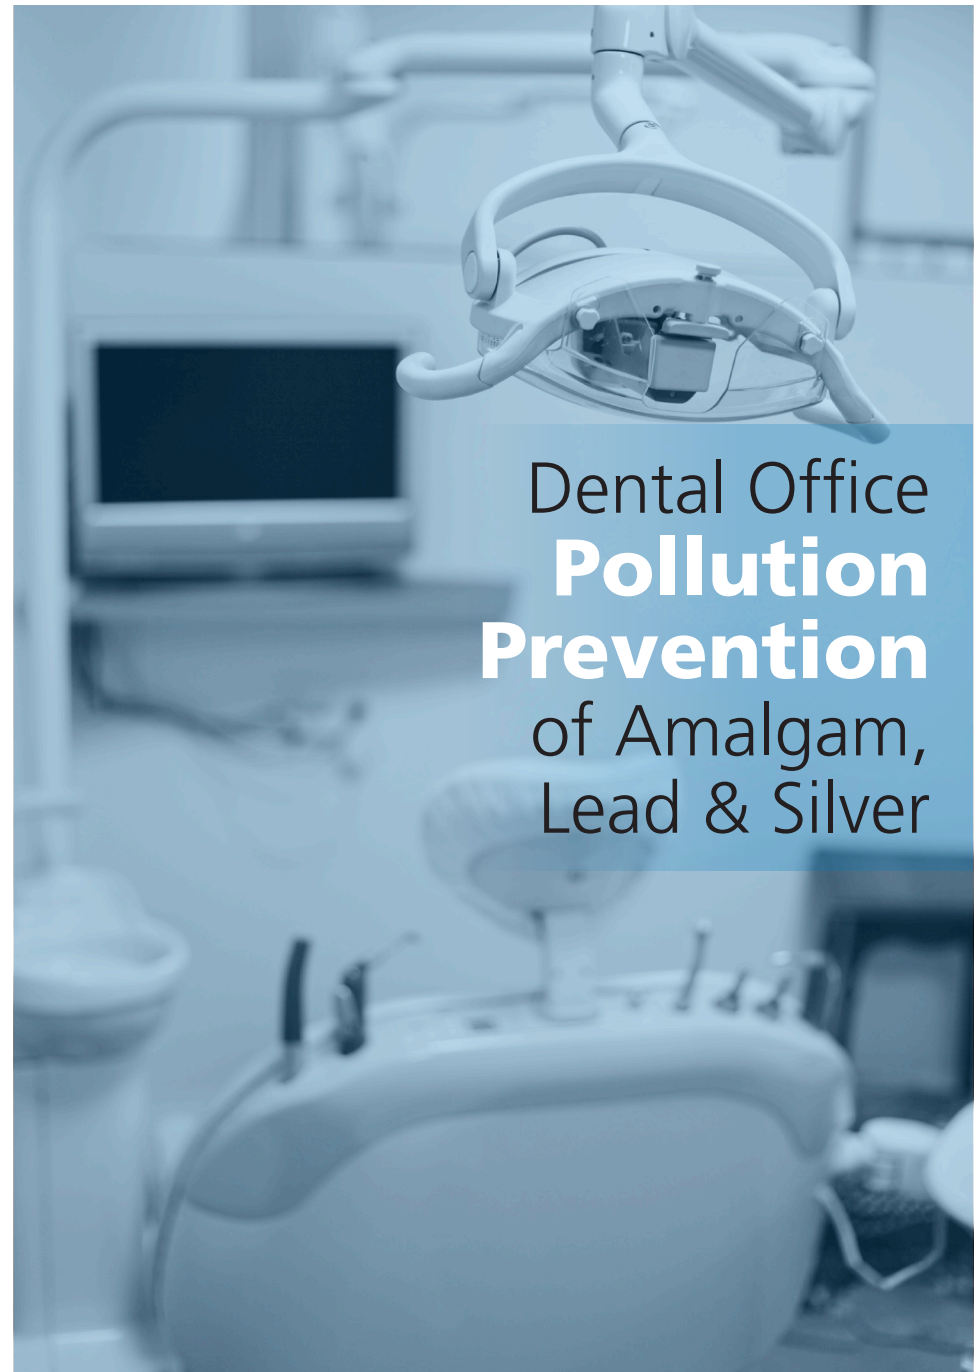

## More Information

**Pollution  
Prevention**  
of Amalgam,  
Lead & Silver

CleanWater  Services

Clean Water Services has been working in partnership with the dental community for the last decade to minimize mercury, silver and lead discharges into the public sewer system. Vacuum lines, sinks and toilets in your office all lead to local wastewater facilities which clean the water and release it into the Tualatin River. Our facilities aren't designed to remove metals like mercury and silver and we need support from business to comply with Oregon law and take steps to reduce pollution. Mandatory amalgam separators have helped reduce pollution but public utilities

(Publicly-owned Treatment Works (POTWs)? like Clean Water Services, are facing stricter permit requirements to further reduce the amount of mercury discharged into the Tualatin River. Clean Water Services will be working in partnership with the Washington County Dental Society, the Oregon Dental Association and the Oregon Board of Dentistry to inspect dental offices in Washington County for compliance and to offer Best Management Practices (BMPs) to help prevent pollution.

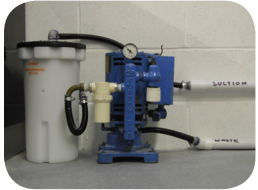

## Best Management Practices

Follow the Best Management Practices (BMPs) to comply with Oregon law and to help maintain water quality in the Tualatin River. Be sure to keep thorough records of all maintenance and recycling occurrences.

### Amalgam

- Don't put any type of amalgam (including teeth with amalgam) in the garbage, red bag, or down the drain.
- Don't rinse devices that contain amalgam over drains or sinks.
- Use non-oxidizing line cleaners to minimize the dissolution of amalgam.
- Make sure your amalgam separators are properly maintained.
- Stock a variety of amalgam capsule sizes to help prevent waste.
- Be sure to place empty capsules in a well-sealed and clearly labeled container for recycling.

### Reusable Chair-Side Traps

- Flush the vacuum system with non-oxidizing, non-bleach, non-chlorine line solution.
- Empty contents into recycling container and replace trap.
- Do not rinse out the trap.

### Vacuum Pump Filter

- Consult with your recycler about their requirements for filters.
- If necessary, decant excess liquid.
- If necessary, store filter separately from other amalgam waste.

### X-Ray Fixer

- Do not pour silver fixer down the drain.
- Make sure to keep fixer and developer separate.
- Contact your local photo developing company; they make accept your fixer.

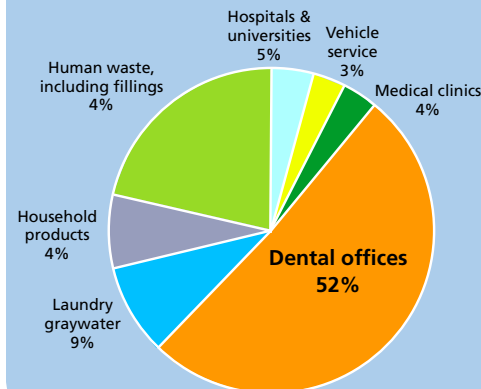

### Lead Foil

- Collect lead foil for recycling.
- Avoid giving lead foil to customers as this may become a liability.
- There are many mail-in programs for dentists for lead waste.
- Contact your local Les Schwab Tire Center to see if they will accept your lead waste.

### Recyclers

Find local, regional, and national recyclers of amalgam, lead foil, and silver fixer on the ODA website ([oregondental.org](http://oregondental.org)) by following the links to [Member Resources](#) » [Professional Resources](#) » [Best Management Practices](#).

### Mercury sources to a Wastewater Treatment Facility

In the absence of dental Best Management Practices and amalgam separators, mercury amalgam waste from dental offices is estimated to be the single largest source of mercury to wastewater treatment facilities.

#### Dental Amalgam

A variety of amalgam waste is generated at a dental office:

- Scrap amalgam
- Used, leaking, or unusable amalgam capsules
- Amalgam captured in chairside traps and vacuum pump screens, including the traps and screens themselves
- Amalgam separator waste
- Contact" amalgam including teeth with amalgam restorations
